Threat Modeling - Worksheet

1. List (in no particular order) potential things which could go wrong and have a negative impact (ie 'risks'). Remember to think about **Confidentiality**, **Integrity**, and **Availability**:

- _____
- _____
- _____
- _____
- _____
- _____
- _____
- _____
- _____
- _____

2. Assign each of these **risks** a **Probability** and an **Impact** score, on a scale of 1-5 (1 being improbable/negligible and 5 being probable/severe). These numbers will be arbitrary - but they are useful for understanding risk profiles.

3. Place those **risks** on the chart below.

PROBABLE					
LIKELY					
POSSIBLE					
UNLIKELY					
IMPROBABLE					
	NEGLIGIBLE	MINOR	MODERATE	SIGNIFICANT	SEVERE

4. Consider whether an individual **risk** should be **Accepted**, **Transferred**, **Mitigated**, or **Avoided**.

Important note: *As a hacker, you bring technical knowledge and threat modeling experience. Please ensure that the most impacted individuals are the final decision makers in how a risk should be managed.*
